

IN THE CLAIMS:

Please AMEND claims 11, 13, 27 and 28, as follows.

1. (Previously Presented) An image processing apparatus comprising:
detection means for detecting the state of resources to be used to output image data;

prediction means for predicting whether or not to abort the outputting of the image data in accordance with an image data to be output and the state of the resources detected by said detection means;

output control means for suspending a start of outputting of the image data, if an abort is predicted by said prediction means; and

storage means for storing the image data which said output control means has suspended,

wherein said output control means performs one of a first sequence in which an output operation of a second image data input after a first image data is started before an output operation of the first image data is finished and a second sequence in which the output operation of the second image data is started after the output operation of the first image data is finished; and

wherein said output control means is allowed to select one of the first sequence and the second sequence when abort is predicted by said prediction means and to perform the second sequence when abort is not predicted by said prediction means.

2. (Original) The apparatus according to claim 1, wherein when second image data to be output exists in addition to first image data for which abort is predicted, said output means outputs the second image data preferentially to the first image data.

3. (Previously Presented) The apparatus according to claim 1, wherein said output control means comprises selection means for selecting whether or not to suspend output image data, for which abort is predicted or forcibly perform outputting.

4. (Previously Presented) The apparatus according to claim 3, further comprising instruction means for instructing said selection means to suspend or forcibly perform output of image data, for which abort is predicted.

5. (Original) The apparatus according to claim 1, further comprising display means for displaying an abort prediction result by said prediction means.

6. (Original) The apparatus according to claim 5, wherein when output of image data is suspended, said display means displays a message indicative thereof.

7. (Original) The apparatus according to claim 1, wherein said output means comprises output cancel means for cancelling output of output-suspended image data.

8. (Previously Presented) The apparatus according to claim 3, further comprising setting means for setting a selection result of said selection means in advance.

9. (Original) The apparatus according to claim 8, further comprising verification means for verifying setting of said setting means.

10. (Previously Presented) An image processing method comprising:
a storage step of storing image data;
a detection step of detecting the state of resources to be used to output the image data stored in the storage step;
a prediction step of predicting whether or not to abort the outputting of the image data in accordance with an image data to be output and the state of the resources detected in the detection step; and
a suspension step of suspending a start of outputting of the image data, if an abort is predicted in the prediction step,
wherein said output control means performs one of a first sequence in which an output operation of a second image data input after a first image data is started before an output operation of the first image data is finished and a second sequence in which the output operation of the second image data is started after the output operation of the first image data is finished;
and

wherein said output control means is allowed to select one of the first sequence and the second sequence when abort is predicted by said prediction means and to perform the second sequence when abort is not predicted by said prediction means.

11. (Currently Amended) An image processing method comprising:

a storage step of storing image data;

an abort prediction step of comparing a resource necessary for outputting with an actual resource for first image data to be output first out of image data that are stored in the storage step and to be output, and predicting whether or not to abort the outputting of the first image data from the comparison result; and

an output order change step of, when abort of output is predicted in the abort prediction step, changing an output order so as to output the first image data after second image data was scheduled to be outputted after the first image data,

wherein said ~~output control means~~ output order change step performs one of a first sequence in which an output operation of a second image data input after a first image data is started before an output operation of the first image data is finished and a second sequence in which the output operation of the second image data is started after the output operation of the first image data is finished; and

wherein said ~~output control means~~ output order change step is allowed to select one of the first sequence and the second sequence when abort is predicted by said ~~prediction means~~ abort prediction step and to perform the second sequence when abort is not predicted by said abort prediction step ~~prediction means~~.

12. (Original) The method according to claim 11, wherein the abort prediction step is performed only when image data to be output exists in addition to the first image data, and the first image data is directly output when no image data to be output exists in addition to the first image data.

13. (Currently Amended) A computer-readable memory comprising:

- a program module of a detection step of detecting a state of resources to be used to output image data;
- a program module of a prediction step of predicting whether or not to abort the outputting of the image data in accordance with an image data to be output and the state of the resources detected in the detection step; and
- a program module of an output step of suspending a start of outputting of the image data, if abort is predicted in the prediction step,

wherein said ~~output control means~~ output step performs one of a first sequence in which an output operation of a second image data input after a first image data is started before an output operation of the first image data is finished and a second sequence in which the output operation of the second image data is started after the output operation of the first image data is finished; and

wherein said ~~output control means~~ output step is allowed to select one of the first sequence and the second sequence when abort is predicted by said ~~prediction means~~ prediction step and to perform the second sequence when abort is not predicted by said prediction step ~~prediction means~~.

Claims 14-25 (Cancelled)

26. (Previously Presented) An image processing apparatus comprising:

a storage control unit, adapted to cause a storage unit, which can store a plurality of job data including a first job data and a second job data input after the first job data, to store job data to be printed;

a print unit, adapted to print job data stored in said storage unit;

a controller, adapted to cause the image processing apparatus to allow an execution of at least one of a first sequence for causing said print unit to start a print operation of the second job data before a print operation of the first job data is finished and a second sequence for causing said print unit to start the print operation of the second job data after the print operation of the first job data is finished when status of the image processing apparatus is a first status in which said print unit can not finish the print operation of the first job data and to allow an execution of the second sequence when status of the image processing apparatus is a second status in which said print unit can finish the print operation of the first job data; and

a certification unit, adapted to perform a certification process in the permitting of a print operation of job data to be printed,

wherein said controller causes said certification unit to perform the certification process when at least one of the first sequence and the second sequence is performed in the first status and causes the image processing apparatus to allow the execution of the second sequence without a performing of the certification process by said certification unit in the second status.

27. (Currently Amended) A job processing method for an image processing apparatus comprising a storage unit adapted to store a plurality of job data including a first job data and a second job data input after the first job data and comprising a print unit adapted to print data stored in said storage unit, the method comprising ~~comprises~~:

a control step of causing the image processing apparatus to allow an execution of at least one of a first sequence for causing said print unit to start a print operation of the second job data before a print operation of the first job data is finished and a second sequence for causing said print unit to start the print operation of the second job data after the print operation of the first job data is finished when a status of the image processing apparatus is a first status in which said print unit can not finish the print operation of the first job data and to allow an execution of the second sequence when a status of the image processing apparatus is a second status in which said print unit can finish the print operation of the first job data; and

a certification request step of performing a request for a certification process in the permitting of a print operation of job data to be printed, to a user by a user interface unit, and

wherein said control step causes the user interface unit to perform the request when at least one of the first sequence and the second sequence is performed in the first status and causes the image processing apparatus to allow the execution of the second sequence without a performing of the request by the user interface unit in the second status.

28. (Currently Amended) The method according to claim 27, wherein the image processing apparatus can print, via said storage unit, at least one of a job data output from a scanning unit and a job data output from a computer,

wherein the control step causes the image processing apparatus to perform either the first sequence ~~of~~ or the second sequence based on a selection instruction input via at least one of an operation unit of the image processing apparatus and an operation unit of the computer when the image processing apparatus is in the first status, and

wherein in the certification request step the request is performed via at least one of an operation unit of the image processing apparatus and an operation unit of the computer.

29. (Previously Presented) the method according to claim 27, wherein said control step causes the user interface unit to perform the request when the first sequence is performed in the first status and causes the user interface unit to perform the request when the second sequence is performed in the first status.

30. (Previously Presented) A computer readable memory on which a job processing method program for an image processing apparatus comprising a storage unit adapted to store a plurality of job data including a first job data and a second job data input after the first job data and comprising a print unit adapted to print data stored in said storage unit, the memory comprising:

a program module of a control step of causing the image processing apparatus to allow an execution of at least one of a first sequence for causing said print unit to start a print operation of the second job data before a print operation of the first job data is finished and a second sequence for causing said print unit to start the print operation of the second job data after the print operation of the first job data is finished when a status of the image processing

apparatus is a first status in which said print unit can not finish the print operation of the first job data and to allow an execution of the second sequence when a status of the image processing apparatus is a second status in which said print unit can finish the print operation of the first job data; and

a program module of a certification request step of performing a request for a certification process in the permitting of a print operation of job data to be printed, to a user by a user interface unit, and

wherein said control step causes the user interface unit to perform the request when at least one of the first sequence and the second sequence is performed in the first status and causes the image processing apparatus to allow the execution of the second sequence without a performing of the request by the user interface unit in the second status.

Claims 31-36 (Cancelled).
